

Everyone got the tool. Not everyone got the setup instructions.

Workbrain enables participants of any skill level to write the instructions that make any AI tool work like it already knows them — **their words, their standards, their way of doing the work** — and they prove it against their own before-and-after. They keep the file and the knowledge of how to leverage it towards their goals and objectives.

4-Week Training Program

90 Minutes Per Week

We Facilitate

You Host

Free For Participants

📄 What It Costs

Hope this email finds you _____

You filled that in before I finished the sentence. **So does the tool everyone in your building is already using** — for every word it writes.

Hope this email finds you well |

well

in good health

rested after the strike

The AI tools we all used today are a lot like autocomplete, at enormous scale, **answering our prompts with the most common response.**

NOTE Not a metaphor: predicting the most likely next token is the literal training objective.

The most common version of the thought is becoming **the noise.**

The most likely word is the most common one — that isn't a flaw, it's the definition. So every draft that comes back starts life as the most common version of the thought. **Multiply that by everyone, every day.**

It is already getting hard to tell where the tool ended and the person began — in an inbox, in an application, in a proposal. **That line is worth being able to draw.**

SOURCE Shumailov et al., Nature 2024 — models trained on model-generated text drift toward the centre and lose the tails.

The average has an **accent**.

"Most likely" is measured over text nobody collected evenly — so the middle belongs to whoever wrote the most of it. Watch what that does to a sentence somebody meant:

WHAT THEY SAID	WHAT COMES BACK
"The elders who hold the language."	→ <i>Key community stakeholders.</i>
"We run the pantry out of the back of the church."	→ <i>We operate a food distribution program.</i>
"She's been doing this since before the county had a program."	→ <i>She is an experienced team member.</i>

Nothing was flagged. Nobody was asked. **The words that were chosen most carefully are the ones it edits hardest** — and the people who chose them are usually the ones a room is already least likely to hear.

A **Workbrain file** makes their words the starting point — so the person furthest from the average gets the same leverage as everyone nearer to it.

SOURCES Hofmann et al., Nature 2024 — models judged people more harshly for writing in a dialect, and debiasing training mostly hid it. Santurkar et al., ICML 2023 — model defaults match some groups' views far more closely than others'.

And it reads them the same way.

Interpretation is prediction too. Handed a request from the coordinator who runs your Tuesday programs, it hears the **average asker's** meaning — not hers:

WHAT THEY ASKED

"Write up what came out of the circle."

"Send a note to our regulars."

"Keep it plain for the families."

WHAT IT HEARD

→ Meeting minutes. Agenda, attendees, action items.

→ A marketing email to returning customers.

→ Simplified — with the two details they needed cut.

AI doesn't ask a clarifying question. It answers the question it assumed — **confidently, and in the same breath**. The shorthand and relatable context it drops is the part a person would have known to keep.

SOURCE Sclar et al., ICLR 2024 — rewording the same question moved measured accuracy by up to 76 points.

05 · THEY'VE SEEN THIS MOVIE

A profile about you, written by **someone else.**

Twenty years of web cookies: a dossier nobody authored, kept for someone else's purposes, invisible to the person it described. **We ended up regulating it.** Everybody remembers how that felt.

Curated Dreams and Restricted Memories **anyone?**

COMMON

On by default on all five major services surveyed. Nobody opted in.

ASSUMED

Inferred, not written — and it rewrites itself over time. OpenAI calls that process "dreaming."

LOCKED

At Microsoft: **exempt from retention policy, not audit-logged, not restrictable** — their own documentation.

RENTED

At Perplexity Enterprise those memories **belong to the organization** — access ends when the person leaves.

You didn't tell your AI assistant what was important and what wasn't. So **who** is deciding what is **important**, **appropriate** and up to **your standard** — and what is **not**?

What does your AI remember about you? 3 easy questions you probably want to know the answer to tonight.

ACCURACY

"What do you remember about me?"

Look for a job title, a project, or a tool you have already moved on from.

Confirm it by opening the memory page itself — if it is still listed there, it is still shaping every answer.

Field guide: last slide.

VOICE

"Describe how I communicate."

Look for an adjective you would never use about yourself.

Confirm it by holding the description next to something you actually wrote last week.

Field guide: last slide.

PRIORITIES

"What matters most in my work?"

Look for what is missing — the thing you would have said first.

Confirm it by asking it to rank three of your real responsibilities, then check the order against yours.

Field guide: last slide.

The easy path answers **for** them, and what it answers with is the average. Identity survives one way only: **the context is theirs, and it goes in every single time.**

The effort doesn't change. The ceiling does.

Nobody, really, accepts those memories at face value though. We do it because it is easy, it is fast and comes back with something that sounds pretty good to us. And **we all paste straight from the tool more often than we'd like to admit.**

DAILY EFFORT

WHAT THE TOOL CAN BE TRUSTED WITH

Individually faster. Collectively identical.

Each person's output improves, and **the group's diversity shrinks**. Ten people produce ten versions of the same thing — and none of them chose that.

SOURCES Doshi & Hauser, Science Advances 2024 · Padmakumar & He, ICLR 2024 · Shumailov et al., Nature 2024. A measured trajectory, still early — we say so out loud.

The day their work stops sounding like **them**.

For someone on your staff: the contribution that used to be recognizably hers stops getting noticed. For anyone you serve who is job-hunting, in a pile where every application is polished by the same tool, **sameness is the rejection**.

The difference has to come from the **people**.

Every application in that stack was written by the same model. Every cover letter, every personal statement, every follow-up note. **Has anyone shown the person who wrote this one how to put themselves back into it?**

Sit in their seat for a second.

Someone in your program — out of work, underemployed, or just starting out — opens the same tool everyone else has. Here is the whole menu available to them today:

Avoid it

Stay away from it. Reasonable — they have heard it cheats, or hallucinates, or takes jobs. Meanwhile every application they are competing against was polished with it. They fall behind quietly, and nobody tells them that is what is happening.

Wing it

Use it for everything, exactly as it comes. Also reasonable — it is free and it is fast. Their cover letter now sounds like the other four hundred, and the thing that made them worth hiring never makes it onto the page.

Those are the two choices they actually have. Neither is a plan, and nobody has offered them a third. **Four sessions is the third.**

Teach them to **author** their own context.

Each person writes a short, plain-text file about their own work — their names for things, their judgment, the standards they hold — and hands it to whatever tool they already use. **Nothing routes through us. No account. Nothing transmitted.**

They leave with a simple file. A plain text file. **A configured, plain text file.** We have all gone through the setup process on a new device — Workbrain is the setup for effective AI usage.

A skill that belongs to **them**.

Their files

Plain markdown they own — who they are, how they work, what they repeat. On their device, not ours.

A method

One job they do every week, written down well enough that a tool — or a new coworker — can follow it.

Proof

Their own before-and-after, run with their own eyes, on their own work.

A credential

A certificate at session four, and **Work Brain Certified** later for demonstrated use — verifiable, and it goes on a profile.

It works in a tool that doesn't exist yet, at their next job, in a model nobody has released. **They keep all of it, free, whether or not they ever come back to you.**

Numbers, not testimonials.

You can say what "good" means

It is four plain checks anyone can run in five minutes, published on a public page. Nobody has to take our word for what a good result looks like — including you.

You can say how we know

Every participant does the same kind of task before any teaching and again at the end, and keeps both. The evidence is theirs, on their own work — not a survey about how the class felt.

You can say what we won't claim

At 90 and 180 days we report back, always with the response rate attached. We do not claim employment outcomes — people tell us what happened, and we pass it on as reported.

PUBLIC The standard, and the six claims this program rests on, written down so anyone who thinks we are wrong can say exactly where — myworkbrain.org/good

One number — and more sessions barely move it.

PROGRAM BASE — PAID ONCE, WHATEVER YOU RUN

Curriculum, facilitator preparation, setup	\$1,000
Loaner device pool, shared across every session	\$900
Insurance and administration	\$500
Follow-up reporting at 90 and 180 days	\$500

EACH SERIES — 4 SESSIONS · UP TO 10 SEATS

Facilitation, morning, afternoon or evening	\$1,600
Printed materials and certificates	\$300

Your first series, all in \$4,800

Every additional series — any day, any time slot +\$1,900

RUN MORE, PAY LESS PER PERSON

\$480 per seat one series · 10 people	\$335 per seat two series · 20 people	\$287 per seat three series · 30 people
---	---	---

WHAT IS NOT ON THIS INVOICE

- No cost to the people in the room — not a fee, not a book, not a device.
- No software license, seat fee or subscription — before, during, or after.
- No second invoice to launch, and nothing lapses when we leave — what they build keeps working, free, permanently.

FROM YOU — THE HALF WE CANNOT BRING

- **The room.** Power, wifi, and the same slot each week — morning, afternoon or evening, whatever fits your members.
- **The machines.** Your lab or laptops if you have them; otherwise just the go-ahead for us to bring the loaner set.
- **The people.** Ten seats filled from the folks you already serve — and your own staff, if you want them in the room.
- **The green light.** The budget line or sponsor, and whoever has to say yes internally.

We never sell to participants. Insurance and background checks documented on request.

Take it, or keep the three questions.

If this is something you want for the people you serve: request a cohort at myworkbrain.org/civic and the packet, the agreement and available dates come back within two business days. If it isn't: **keep the three questions, run them with your members or your staff, and we are square.** There is no follow-up sequence.

"The homogenization research is early."

It is, and we say so on the slide. What isn't early: memory on by default, profiles nobody authored, and the before-and-after each person measures on their own work. The case never rests its weight on the scary slide.

"This sounds anti-AI. We're trying to drive adoption."

Four 90-minute sessions of hands-on building with the tool each person already uses. The foundations hour exists so the adoption is informed. We teach use — the caution is the seatbelt, not an argument against the car.

"The folks I serve need results now, not voice lessons."

Everyone's output is polished now, and readers pattern-match the house style — in hiring, in sales, in grant review. When polish is table stakes, what survives is whose judgment shows. That is an output argument, not a taste argument.

APPENDIX B · THE HONEST CONCESSIONS

"Isn't this prompt training with extra steps?"

Prompt phrasing doesn't transfer between tools — the research is clear. An owned file does. The room demonstrates the difference to itself, in five minutes, on their own work.

"You teach people not to sound like the machine... using the machine."

The same way a writing class uses a word processor. The tool drafts; the person and their file decide. Improve what they do — don't replace it.

What we concede without a fight

Average is fine for boilerplate; the file exists for the work that carries someone's name. And a context file steers voice — it does not guarantee it. The promise is authorship plus evidence, never magic.

Where the memory lives.

Claude Settings → memory. Viewable by topic; import and export are documented.	ChatGPT Settings → Personalization → Memory. A summary page; background synthesis keeps updating it.	Gemini Saved Info. Note that its memory and its Gems are mutually exclusive surfaces.
Microsoft 365 Copilot Settings → personalization. Stored in the person's Exchange mailbox; on by default.	Perplexity Settings → memory. In Enterprise, those memories belong to the organization.	

Paths current as of September 2026 — vendors move them; search "<service> memory settings" if one has drifted. And remember: the page shows only the part they show you.
